

tip the post, not the platform.

On-chain tipping for X (Twitter), built on Somnia Network.
Sub-second finality. Sub-cent gas. Tip anyone by handle.

ENCODE AGENTATHON · LIVE ON SOMNIA TESTNET

THE PROBLEM

Tipping creators is broken

Web2 tipping

Twitter Tips, Patreon, Ko-Fi.

- > Both sides must sign up
- > 2-30% in fees
- > Payouts take days

Web3 tipping

Chain-native transfers.

- > Recipient needs a wallet on the right chain
- > Gas often costs more than the tip
- > No in-feed gesture

Result: tipping is a friction-filled chore almost no one does.

THE SOLUTION

Tip any X handle in one click

- > **Tip anyone – even non-crypto users.** Tips to unregistered handles are held in an on-chain escrow, keyed by the handle.
- > **One-click claim.** Recipient signs up once (Privy / wallet), the backend binds their wallet on-chain, funds land instantly.
- > **Tip from inside X.** A Chrome extension injects a Tip button into the feed and onto profiles.
- > **Two modes, one contract.** Direct tip (extension/web) and Twitter-command tip via an AI bot.

WHY SOMNIA

Micro-tipping is finally economically viable

PROPERTY	TYPICAL L1/L2	SOMNIA	WHY IT MATTERS
Finality	2-12s	< 1s	In-feed tip feels like Web2
Gas / tip	\$0.05-\$1.00	< \$0.001	\$0.10 tips make sense
Throughput	100-4,000 TPS	1,000,000+ TPS	Viral headroom
EVM	Yes	Yes	Solidity + viem port cleanly

Sub-second finality turns "I'm sending a transaction" into "I just tapped a button."

HOW IT WORKS — MODE A

Direct tip (extension / web)

Click Tip on X → Escrow.tip(handle) → registered?

Registered recipient

STT transfers directly to their wallet, in < 1 second.

Unregistered recipient

STT locked in escrow under the handle. Backend indexes a claim; recipient claims after sign-up.

The user's own wallet signs the transaction (Privy embedded wallet on web, MetaMask in the extension).

HOW IT WORKS – MODE B + CLAIM

Tip by tweet, claim with one sign-up

Mode B – Twitter command

```
@xeniaBot tip @bob 5 STT
```

- > Pre-deposit + authorize the bot
- > Bot parses intent with **Gemini**
- > Calls tipOnBehalf() – bot can only forward, never withdraw

Claim flow

- > Recipient signs up (Privy)
- > Backend binds handle → wallet on-chain (immutable)
- > claim(handle) pulls all pending escrow tips

ARCHITECTURE

One escrow contract, many surfaces

SOMNIA NETWORK — SMART CONTRACTS

Escrow.sol

tip · claim · deposit · authorize · tipOnBehalf · refund

ScreenshotRegistry.sol

on-chain proof-of-post

▲ viem (RPC) ▼

Backend

Express + Drizzle + Neon Postgres · REST API · Privy auth · Gemini Twitter bot

React web app

Privy embedded wallet

Chrome extension

MetaMask · in-feed + profile Tip button

WHAT'S BUILT

Working end-to-end on testnet

- [x] Two Solidity contracts deployed & live
- [x] Real on-chain tip / claim / deposit (user-signed)
- [x] Chrome extension: in-feed + profile Tip button
- [x] Escrow tips indexed to Postgres as claims

- [x] Gemini-powered Twitter command bot
- [x] Privy auth (X or wallet) + embedded wallets
- [x] Canonical handle identity across all flows
- [x] Deploy-ready: Railway + Neon, preflight checks

Escrow `0xEf0ca54F3C195737880127df62069C5B5A17B458` · chainId 50312

SECURITY

Built so funds **can't be touched** by the wrong party

- > nonReentrant on every value-moving call
- > Fees tracked separately from user funds
- > Wallet binding immutable once set

- > Bot delegation scoped to forwarding only
- > 90-day sender refund safety net
- > Two-step ownership transfer

The backend never holds user keys – Privy embedded wallets stay client-side.

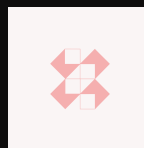

LIVE DEMO

Visit a profile → tip → on-chain

open any X profile → Tip @user → amount + wallet → STT in their wallet

```
handle @user → resolved to their registered wallet
tip() → direct transfer, < 1s, verifiable on the Somnia explorer
unregistered @user → held in escrow until they claim
```

No app login needed – the sender's own wallet signs the transaction. The recipient does nothing; if they haven't joined yet, the tip waits safely in escrow.
